1 BACKGROUND

Objectives and scope

The Group of 100 has commissioned Milliman to generate a standardised set of discount rates to be made publicly available for the purpose of discounting employee benefit liabilities under Australian Accounting Standard 119 (AASB 119). The scope of the work is limited to Australian employee benefit schemes, and excludes any schemes of foreign subsidiaries of domestic entities which are denominated in foreign currency.

This report provides the Australian corporate bond discount rate curve as at the end of January 2016 produced under the methodology and assumptions described in the 'Discount Rates for Australian Employee Benefit Liability Valuation' report.

Reliance and limitations

In producing this report, we have relied upon the following information:

- Capital market data as sourced from Bloomberg. Should this data be incorrect, it could materially affect the analysis and conclusions drawn from it.

Users of this report should also be aware that it is subject to the following limitations:

- Current debt market conditions. Issuance of corporate bonds is subject to change over time, which may impact upon whether the accounting standard requirements of a deep market are met.
- Current capital market conditions, in particular the liquidity and credit ratings of corporate bond markets, which can change rapidly. The asset calibration set could change very rapidly under stressed market conditions.
- Reassessments of the suitability of the asset calibration set would be needed if the AAA and/or AA corporate bond market thins, which would require a prospective change to the assets selected for AASB 119 calibration purposes.

This report was prepared solely to provide assistance to the Group of 100 and the relevant Actuaries Institute of Australia subcommittee. Milliman does not intend to benefit and assumes no duty or liability to other parties who receive this report. Milliman recommends that any recipient of this report be aided by its own actuary or other qualified professional when reviewing the report. Milliman does not certify the information in this report, nor does it guarantee the accuracy, completeness, efficacy, or timeliness of such information. Use of such information is voluntary and should not be relied upon unless an independent review of its accuracy, completeness, efficacy, and timeliness has been performed. Materials may not be reproduced without the express consent of Milliman.

2 METHODOLOGY AND ASSUMPTIONS

Summary of the asset calibration set

The set of assets to be used to calibrate the discount rate curve is defined by those securities that meet the following conditions:

1. Individual bonds must have the following characteristics:
 - a. Physical bonds, with no embedded derivatives (e.g., callable, puttable, convertible, extendible, variable/floating coupon, index-linked)
 - b. High-quality corporate bonds issued by both domestic and foreign entities
 - c. Payments denominated in Australian dollars (AUD)
 - d. Pay fixed (or zero) coupons, non-inflation-linked
 - e. Maturity terms of greater than one month and less than 10 years
 - f. Minimum amount outstanding on an individual security of \$100 million
 - g. Securitised bonds are included

2. A deep market for these bonds must exist, as characterised by the ready availability of observable prices and current trades.

What is meant by high quality?

Figure 1 defines the credit ratings by each agency that map to each of these broad categories. This forms the basis for the asset calibration set used in this report.

Figure 1: Definition of AAA and AA Credit Ratings by Agency

Category	AAA	AA
S&P	AAA	AA+, AA, AA-
Fitch	AAA	AA+, AA, AA-
Moody's	Aaa	Aa1, Aa2, Aa3

Where there is disagreement between credit rating agencies on particular securities, we use the following conditions:

- If a security has at least two AAA ratings, then it is classified as a AAA security
- If a security has at least two AA ratings, then it is classified as a AA security
- If a security has only been rated by two agencies with different ratings, then the lower rating is used
- If a security has only been rated by one agency, then that rating becomes the sole reference

Hereafter, all references to credit ratings refer to those that meet the above conditions. For the purposes of this paper, we refer to this as the combined credit rating.

Corporate bond universe

The table in Figure 2 shows the decomposition of the market by the combined credit rating satisfying all but the 'high quality' characteristic.

Figure 2: Australian Corporate Bond Market Outstanding Debt by Combined Credit Rating (\$ millions)

Combined Rating	Number of Securities	Outstanding (\$ Millions)	% of Total
AAA	16	12,250	11.2%
AA	120	32,075	29.2%
A	166	45,880	41.8%
BBB	73	18,630	17.0%
BB	3	950	0.9%
Total	378	109,785	100.0%

Source: Milliman analysis based upon Bloomberg data as at 29 January 2016.

The table in Figure 3 shows the universe of AAA and AA bonds used in the asset calibration set broken down into the composition of their respective S&P, Moody's and Fitch ratings.

Figure 3: Australian AAA/AA Corporate Bond Market Outstanding Debt (\$ millions)

Credit Rating Composition	Number of Securities	Outstanding (\$ Millions)	% of Total
Combined Credit Rating of AAA			
3 AAA ratings	0	0	0.0%
2 AAA ratings	13	11,475	93.7%
1 AAA rating	3	775	6.3%
Total Combined AAA	16	12,250	100.0%
Combined Credit Rating of AA			
3 AA ratings	46	14,370	44.8%
2 AA ratings	61	14,675	45.8%
1 AA rating	13	3,030	9.4%
Total Combined AA	120	32,075	100.0%

Source: Milliman analysis based upon Bloomberg data as at 29 January 2016.

Interpolation methodology

For fitting the discount curve to the asset calibration set, the Merrill Lynch Exponential Spline (MLES) method with nine exponential basis functions was used calibrated to yield data as at 29 January 2016, weighting each issue by the inverse duration of the issue. The results of the calibrated MLES parameters are shown in Figure 4.

Figure 4: MLES-Calibrated Parameters as at 29 January 2016

MLES Parameters		
Long-Run	b0	5.7%
Param1	λ1	117.2%
Param2	λ2	76.5%
Param3	λ3	-163.0%
Param4	λ4	41.9%
Param5	λ5	44.9%
Param6	λ6	49.1%
Param7	λ7	-96.1%
Param8	λ8	15.9%
Param9	λ9	13.6%

For the calibration of the MLES basis functions, an adjusted R-squared statistical goodness-of-fit measure was applied to the difference between modelled and actual bond prices.

An adjusted R-squared statistic value close to 100% indicates a very good fit, whilst lower values (closer to 0%) indicate poor fits. Figure 5 shows the results of the interpolation analysis used.

Figure 5: Adjusted R-Squared Statistic as at 29 January 2016

Regression Statistic	
Adjusted R-Squared	95.2%

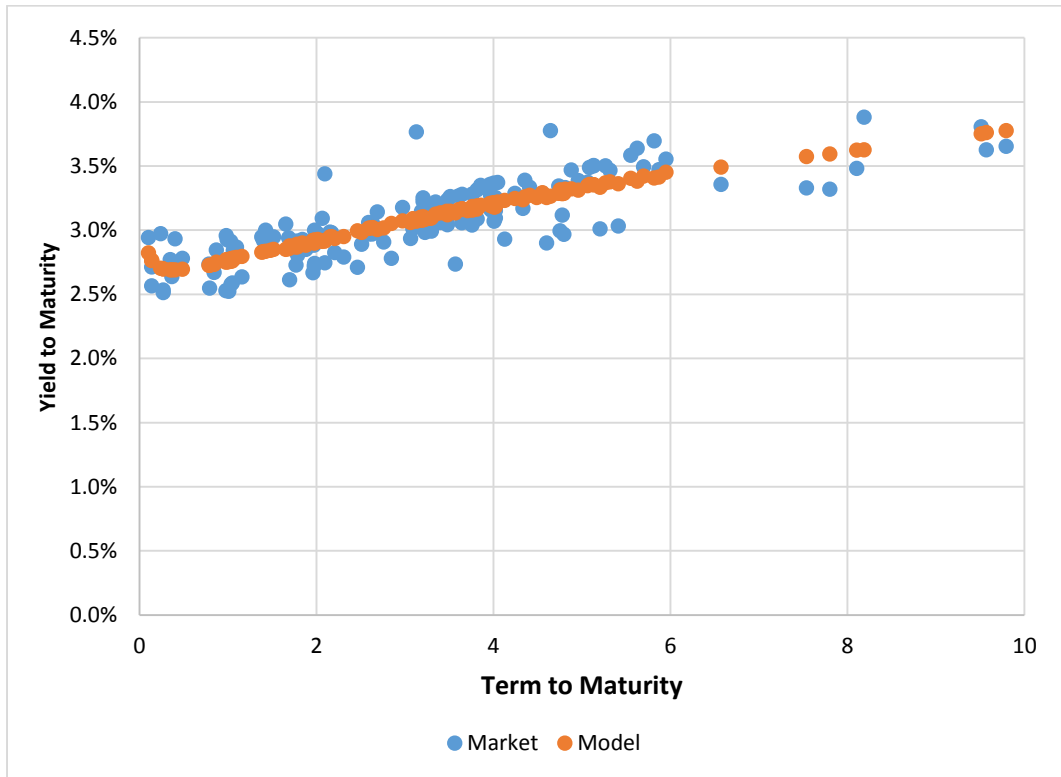

Extrapolation methodology

For rates beyond 10-year maturities, the fitted yield curve has been extrapolated by assuming that 1-year forward rates remain constant for all subsequent maturities. This is based on the 1-year forward rate between 9- and 10-year maturities, based on the fitted MLES model.

3 FITTED YIELD CURVE

Figure 6 shows the modelled yield-to-maturity for each bond in the asset calibration set, compared with the actual yield-to-maturity, using the MLES method with inverse duration weightings. Note that these are the same bonds as those discussed and analysed in Section 2 above.

Figure 6: Modelled vs. Market Yields to Maturity for Asset Calibration Set Using the MLES Method with Inverse Duration Weightings

Figures 7 and 8 show the resulting spot and forward yield curves of one to 50 years for the calibration set using the MLES method and extrapolated with the constant forward rate extrapolation method. Spot rates shown are quoted as annually compounded rates on zero coupon bonds with maturities of the specified term, forward rates shown are 1-year forward rates ending at the specified term.

Figure 7: Spot and Forward Rate Curves for Asset Calibration Set Using an MLES Interpolation and Constant Forward Rate Extrapolation Method

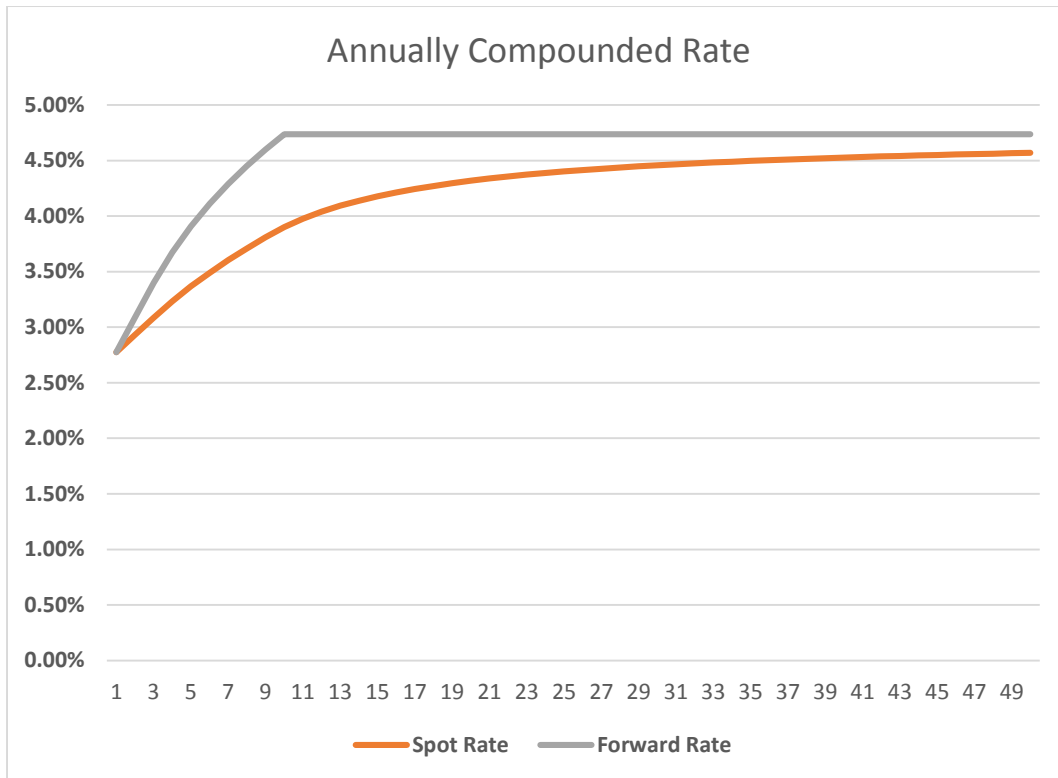

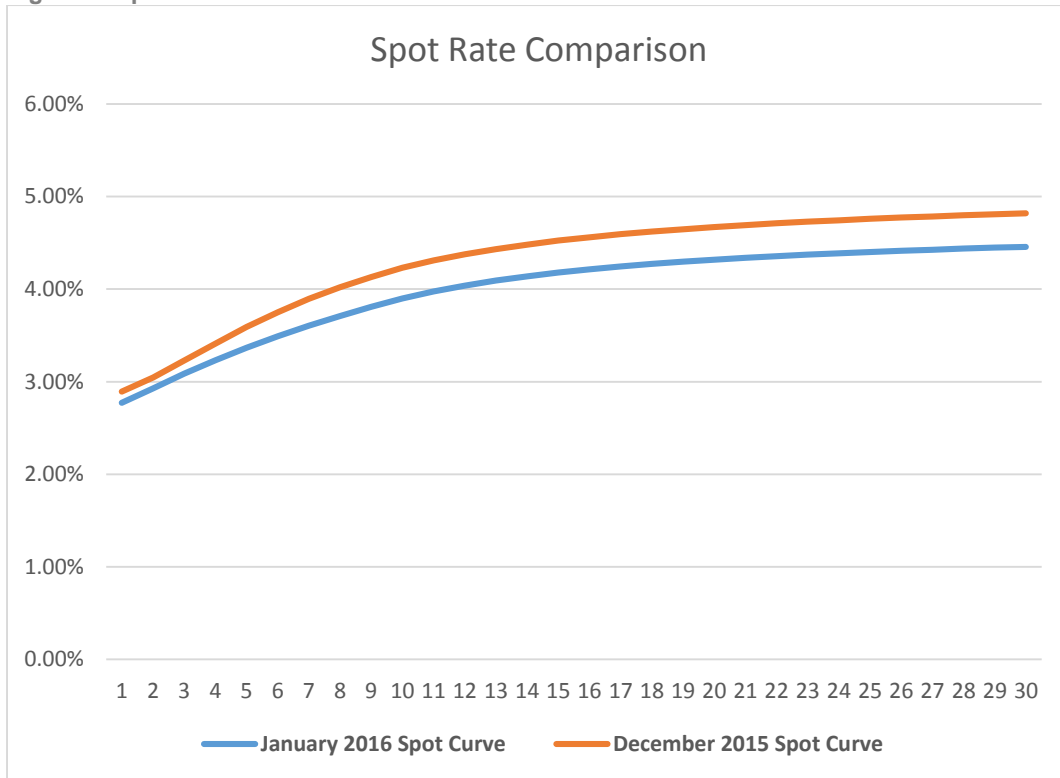

Figure 8: Spot and Forward Rate Curves for Asset Calibration Set Using an MLES Interpolation and Constant Forward Rate Extrapolation Method

Term (Years)	Spot Rate	Discount Factor
1	2.77%	0.973011
2	2.93%	0.943894
3	3.09%	0.912867
4	3.23%	0.880530
5	3.37%	0.847421
6	3.49%	0.813967
7	3.60%	0.780494
8	3.71%	0.747242
9	3.81%	0.714392

11	3.98%	0.651240
12	4.04%	0.621789
13	4.09%	0.593670
14	4.14%	0.566822
15	4.18%	0.541189
16	4.21%	0.516715
17	4.24%	0.493348
18	4.27%	0.471037
19	4.30%	0.449736
20	4.32%	0.429397
21	4.34%	0.409979
22	4.36%	0.391438
23	4.37%	0.373736
24	4.39%	0.356835
25	4.40%	0.340698

Term (Years)	Spot Rate	Discount Factor
26	4.41%	0.325291
27	4.43%	0.310580
28	4.44%	0.296535
29	4.45%	0.283125
30	4.46%	0.270321
31	4.47%	0.258096
32	4.47%	0.246424
33	4.48%	0.235280
34	4.49%	0.224640
35	4.50%	0.214481
36	4.50%	0.204782
37	4.51%	0.195521
38	4.52%	0.186679
39	4.52%	0.178237
40	4.53%	0.170177
41	4.53%	0.162481
42	4.54%	0.155133
43	4.54%	0.148117
44	4.55%	0.141419
45	4.55%	0.135024
46	4.55%	0.128918
47	4.56%	0.123088
48	4.56%	0.117521
49	4.57%	0.112207
50	4.57%	0.107132

Figure 9 shows the resulting spot rate curve of one to 30 years relative to the prior period fitted curve.

Figure 9: Spot Rate Curves Relative to Prior Period Fitted Curve

Milliman is among the world's largest providers of actuarial and related products and services. The firm has consulting practices in healthcare, property & casualty insurance, life insurance and financial services, and employee benefits. Founded in 1947, Milliman is an independent firm with offices in major cities around the globe. For further information, visit milliman.com.
